CLIMATE LITERACY ACADEMY

Visitor cards

Designed, not yet tested in practice. Smelling and tasting are optional. The detailed teacher text is in a separate pack. The date, length, language and format of the Antalya session are still awaiting confirmation from the organisers.

Weather or climate?

1. Participants observe the sky and read the thermometer.
2. They sort statement cards into “today” and “many years”.
3. They discuss why one week of observations cannot replace a 30-year normal.

Learning outcome: The weather of one day or one week cannot, on its own, show how the climate is changing.

Does covering soil change the water?

1. Participants prepare two identical trays and put dry straw on one only.
2. They pour 100 mL of “rain” on both trays at the same time.
3. They measure the water collected and compare how cloudy it is.

Learning outcome: In a fair comparison only one thing changes; a small model cannot give a definitive result for a field.

Take a little first, add more if you want

1. Participants compare two apple samples that look different, using their senses.
2. They take a small portion and may ask for more.
3. They weigh, as a team, the edible apple left on the plates.

Learning outcome: Appearance, liking and safety are different things; smell and taste do not show that food is safe.
